## “Order Food”- Through Mobile App

**Business Requirement:** We had an opportunity to work for a client based at United States who has decided to extend his retail online business to mobile app. The requirement is to order food through mobile app by selecting the nearby restaurants through tracking the current location of the user. The user can order the food online by selecting the required restaurant and food menu.

**Our Solution:** We have developed the mobile application on Android technology. We have added features like the user can identify the nearby restaurants without using GPS as well as by giving input. The user can select the restaurant, food menu as per the need with mentioned parameters like time of delivery, pricing and offers for the day. User can pay for the food online through payment gateway. We have developed the payment feature in a secured way. The mobile app has also added features such as selecting the offers of the week in advance.

### About Client

**Industry:** Hospitality

**Location:** Texas, USA.

**Technologies:** Android, JAVA, .

**Business Impact:** The mobile has really helped our client to increase its territory of business with efficient business process. It has increased the productivity of our client.
